

The Dilemma of Science and Technology: Biomimetic Approach

Seyed Kazem Alavipanah*¹, Jafar Jafarzadeh²

Many scientists and experts have tried to provide better conditions for human comfort with the help of science and technology. From the following two paths, such as existence and non-existence, wisdom and love, matter and meaning, color and colorlessness, medicine and placebo, and in short, we are too far and too close. Since many of the ancients, including sages, poets, and philosophers, are examples that have watered down their inner pleasures and love, here we have also used their poems and sayings to prove our claim. Some of the functions of nature and living things that have evolved in the realm of nature have been examined as a model in this discussion. To do so, the functioning of many organisms, not just living organisms but also non-living organisms such as viruses, including the coronavirus, can be the basis for new patterns and definitions of future scientific and technological algorithms. Paying attention to the subject of the biomimetic shows us brilliant ways that we did not imagine before.

Keywords: Dilemma, Decision Making, Poetry, Environment, Technology, Algorithm, Biomimetic.
