

A Glance at Iridology

Z. Momtazian¹

Abstract

Since 1800s, Iridology has developed into a scientific analysis of patterns and structures in the iris of the eye. The iris is the portion of the eye showing color. It reveals body constitution, inherent strengths and weaknesses, health levels, and transitions that take place in a person's body according to their way of life. Some physicians believe that Iridology is a useful method to diagnose disease patterns in human body while some others disagree with this notion.

Keywords: Iridology, Eyes Color, Disease Diagnosis.
